Fellowship Practice Exam

December 2014

WRITTEN EXAMINATION
SHORT ANSWER QUESTIONS

EXAMINATION TIME – 360 MINUTES

Directions to Candidates

1. All questions must be attempted.
2. All SAQs are of equal value, there is no specific mark allocation to individual points within each SAQ.
3. Answer each question in the spaces provided in this booklet.
4. Write your candidate number on every page – the booklet will be separated for marking purposes.
5. DO NOT write your name on the examination booklet.
Candidate number ________
SAQ 1

A 40 year old man was injured in a campsite accident. He was burned when his shirt was set alight by an open fire. He has full thickness thermal burns to his entire right upper limb and entire anterior chest wall. There are no other injuries. Soon after arrival in your regional ED, he is intubated and ventilated. Ventilatory parameters are satisfactory. He weighs 100kg.

1. Estimate the percentage of total body surface area (TBSA) burned in this patient, showing your method of calculation.

The patient has received initial fluid resuscitation and is cardiovascularly stable.

2. What is Parkland’s formula?

3. Use Parkland’s formula to calculate the volume and rate of fluid you will use over the next 24 hours. State which type of fluid you will use.

4. List five (5) parameters used for intravenous fluid rate adjustment in this patient.
A 47 year old lady presented to the emergency department with syncope and altered conscious state. She has a past medical history of hypertension, paroxysmal atrial fibrillation and depression.

Her observations in the emergency department are as follows:
GCS 14 (E3, V5, M6)
BP 60/40 mmHg

An ECG is taken on arrival and shown on the page opposite.

1. Describe her ECG giving three (3) positive and two (2) relevant negative findings

2. Describe four (4) different steps you would take to treat her hypotension.

3. List two (2) pros and two (2) cons of using activated charcoal for this patient.
Candidate number _______
SAQ 3

A 68 year old man presents to the ED with ongoing epistaxis, of spontaneous onset. The patient’s medications include warfarin.

1. List six (6) features in the History that are important for your assessment of this patient.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

2. The patient is bleeding only from Kiesselbach’s plexus (Little’s area). He is haemodynamically stable. Outline six (6) steps you would take to control his epistaxis.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

3. List three (3) pieces of advice you would give him on discharge.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________
SAQ 4

A 6 year old boy is brought in by ambulance with a penetrating chest wound after an incident with a knitting needle and loom bands (small rubber bands) while playing with his little brother.

A clinical photograph is supplied
SAQ 4 continued

1. Write three (3) statements that describe the injury in this photo.

2. List six (6) possible complications that may be associated with this presentation

The patient’s chest pain worsens. Vital signs are:

RR   40    /min
PR   160    bpm
BP   60    systolic mmHg
SaO2 98%    on room air

3. Describe your three (3) most important management priorities
Candidate number ________
SAQ 5

An office building collapse results in a large number of injured casualties in a major regional town served by only one hospital with an emergency department. The police have deemed the site safe for emergency responders.

1. List four (4) designated areas that will be required to be set up at the scene to coordinate the medical response to this incident.

2. Outline four (4) differences between Disaster triage and Emergency Department triage.

<table>
<thead>
<tr>
<th>Disaster Triage</th>
<th>Emergency Department Triage</th>

__________________________
Candidate number _______
SAQ 6

An 82 year old woman from a nursing home is sent in by ambulance with increasing confusion and agitation. She is combative and agitated.

1. List five (5) differential diagnostic categories. Give 2 examples of each.

<table>
<thead>
<tr>
<th>Diagnostic category</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. You decide that her agitation needs management. List two (2) drugs and doses for managing her agitation. List two (2) potential adverse effects for each drug.

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dose</th>
<th>Adverse effects</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

3. List three (3) features distinguishing delirium from dementia

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
SAQ 7

A 22 year old male is brought in by ambulance having been involved in a high speed motor vehicle accident. On arrival his observations are as follows:

GCS 13 (E3, M6, V4)
PR 140 bpm
BP 80/50 mmHg
SaO2 96% on room air

He has no significant past history and is on no medication

A portable pelvic xray is performed as part of his workup.
SAQ 7 continued

1. Describe the three (3) most important positive findings.

2. List five (5) treatment priorities relevant to this patient

3. Describe four (4) essential elements of a massive transfusion protocol
SAQ 8

A 6 year old girl is brought to the emergency department by her concerned parents. She is unwell and complaining of a painful right eye. Her temperature is 38°C. Her left eye region is normal. This is her photograph.
SAQ 8 continued

1. List four (4) examination findings you will look for, which would suggest a major complication.

<table>
<thead>
<tr>
<th>Examination finding</th>
<th>Complication</th>

Serum Glucose 5.0
SAQ 10

A 30 year old woman presents to the ED complaining of fever, headache, arthralgia and photophobia. She has been unwell for 5 days. Her symptoms initially started like an upper respiratory tract infection, and have not improved despite oral antibiotics.

1. List five (5) contraindications for lumbar puncture.

_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________

A lumbar puncture is performed and the results are shown on the opposite page.

2. What are the two (2) most likely diagnoses?

_____________________________________________________________________
_____________________________________________________________________

3. List 3 features of the CSF that support your diagnoses

_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________

4. List two (2) pros and two (2) cons for the administration of intravenous antibiotics in this patient

<table>
<thead>
<tr>
<th>Pros</th>
<th>Cons</th>

Candidate number ______
SAQ 11

A 65 year old male is brought to your tertiary emergency department with progressively increasing weakness in his legs

1. Outline three (3) key clinical differences between Guillaine Barre syndrome and acute spinal cord compression

<table>
<thead>
<tr>
<th>Guillain Barre</th>
<th>Acute spinal cord compression</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2. On examination the patient has bilateral lower limb weakness with loss of sensation from the nipples down, and absent sphincter tone. What is the most likely diagnosis?

3. List five (5) potential causes for this condition in this patient.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
Candidate number ________
SAQ 12

A 35 year old woman presents to the emergency department with fever, rigors and vomiting. She is 5 days post chemotherapy (4th cycle) for breast cancer. On examination her observations are as follows:

<table>
<thead>
<tr>
<th>Observation</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temp</td>
<td>39 °C</td>
</tr>
<tr>
<td>HR</td>
<td>120 /min</td>
</tr>
<tr>
<td>BP</td>
<td>80/60 mmHg</td>
</tr>
<tr>
<td>RR</td>
<td>28 /min</td>
</tr>
<tr>
<td>Sats</td>
<td>96%</td>
</tr>
</tbody>
</table>

1. Describe your four (4) treatment priorities

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

2. List 5 investigations and give justification for each

<table>
<thead>
<tr>
<th>Investigation</th>
<th>Justification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. List four (4) factors that influence antibiotic choice

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________
SAQ 13

A 47 year old man presents with a sudden severe headache and confusion.

A single slice of his non contrast CT scan is shown.
SAQ 13 continued

1. Describe four (4) relevant findings on his CT scan.

2. What is the most likely diagnosis?

3. List four (4) important measures for neuroprotection in the emergency department.

4. His BP is 200/100 mmHg. What antihypertensive will you use, include dose and route.

5. What systolic BP range are you aiming for in mmHg?
Candidate number _______
SAQ 14

A 5 year old boy presents with an exacerbation of his known asthma.

1. What four (4) signs on physical examination would suggest a severe (but **NOT** life threatening) exacerbation?

2. List four (4) drugs with their doses, routes and indications for the use in the treatment of childhood asthma in the emergency department.

<table>
<thead>
<tr>
<th>Drug</th>
<th>Dose</th>
<th>Route</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

3. List five (5) criteria for discharge.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
SAQ 15

A 45 year old man presents with vague symptoms of central dull chest pain and mild shortness of breath on exertion for the past 3 days.

His observations are:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>37 °C</td>
</tr>
<tr>
<td>BP</td>
<td>120/70 mmHg</td>
</tr>
<tr>
<td>RR</td>
<td>18 /min</td>
</tr>
<tr>
<td>O₂ saturations</td>
<td>99% on room air</td>
</tr>
</tbody>
</table>

An ECG is taken and is shown on the opposite page

1. Interpret his ECG giving three (3) positive findings.

________________________________________________________________________________________

________________________________________________________________________________________

________________________________________________________________________________________

2. List four (4) differential diagnoses for this appearance on the ECG.

________________________________________________________________________________________

________________________________________________________________________________________

________________________________________________________________________________________

________________________________________________________________________________________

3. List three (3) features on assessment that would determine disposition.

________________________________________________________________________________________

________________________________________________________________________________________

________________________________________________________________________________________
Candidate number ________
SAQ 16

A 38 year old woman presents with right upper quadrant pain and jaundice for 3 days. She has a past history of cholelithiasis and a penicillin sensitivity producing a rash.

Her observations are as follows:
BP 95/70 mmHg
HR 125 /min
RR 24 /min
O₂ saturations 99% on room air
Temperature 39.2 °C
GCS 15

1. What is the presumptive diagnosis?

2. List four (4) important investigations to obtain in this woman.

3. List four (4) management priorities.

4. The woman responds to your treatment and her vital signs normalise. You are asked to write ongoing orders for admission. List 4 orders and their doses.
SAQ 17

A 22 year old man presents with facial pain and a rash.

A clinical photograph is shown below.
SAQ 17 continued

1. What is your provisional diagnosis?

_____________________________________________________________________

2. Describe four (4) features on the clinical photograph that support this diagnosis.

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

3. List five (5) important complications of this presentation.

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________

3. List three (3) key features on assessment that would mandate admission.

_____________________________________________________________________

_____________________________________________________________________

_____________________________________________________________________
Candidate number _______
SAQ 18

A 17 year old patient with severe spastic quadriplegia secondary to cerebral palsy is brought to the emergency department. The patient lives at home but is dependent on her parents for full care. She has been unwell for 48 hours with cough, fevers and increasing drowsiness.

1. Describe four (4) features on history that would determine that this patient requires inpatient admission.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

2. The ambulance crew have been unable to obtain IV access despite multiple attempts. Describe three (3) options of obtaining access for administration of medication.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

3. The patient is diagnosed with a severe pneumonia. The patient’s parents would like full resuscitation with intubation and intensive care if required. Describe six (6) points to discuss with the family.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
Candidate number ______
SAQ 19

A 25 year old man is brought to your emergency department following a work place injury. He was cleaning equipment with a high pressure hose that snapped, striking him in the throat. He is seated upright on the ambulance stretcher, drooling and not talking. On examination he has a soft but audible stridor. His observations are all within the normal range.

1. List five (5) pieces of equipment you would like available for immediate management of his airway.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

2. Describe pros and cons for three (3) different options for securing his airway.

<table>

SAQ 20 continued

1. What is your diagnosis?

________________________________________________________________________

2. What are the two (2) most likely underlying causes and why?

________________________________________________________________________

________________________________________________________________________

3. List four (4) complications of this condition.

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

4. List five (5) features that will help determine prognosis on admission?

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________

________________________________________________________________________
Candidate number ______
SAQ 21

You have been asked to write a protocol for chemical restraint in the emergency department.

1. List five (5) key stakeholders.

2. List five (5) essential generic elements of any written protocol document.

3. List three (3) drugs to be included in the protocol. Include doses and route.

4. List three (3) indications for chemical restraint in the emergency department.
ECG SAQ 22
SAQ 22

A 13 year old boy has a syncopal episode while playing sport. There was no trauma. He is unconscious for one minute and there is no seizure activity during this time, nor evidence of a post-ictal phase.

His observations are as follows:

<table>
<thead>
<tr>
<th>BP</th>
<th>105/70 mmHg</th>
</tr>
</thead>
<tbody>
<tr>
<td>HR</td>
<td>90 /min</td>
</tr>
<tr>

</tr>
</tbody>
</table>

1. What is the most likely organism?

2. What antibiotic and dose will you administer?

3. What was the conclusion of the ARISE trial on sepsis and EGDT?

4. List four (4) potential uses of bedside ultrasound in this patient.
SAQ 24

A 22 year old man presents with a hand injury after coming off a motorbike. He is complaining of pain in his left wrist and has no other injuries.

An xray is taken and is shown below.
1. Describe his xray giving three (3) relevant findings.

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

2. List 3 short term and 3 long term complications of this injury.

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

3. Describe four (4) steps in your management.

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________
Candidate number _______
SAQ 25

A 35 year old lady presents to your emergency department via ambulance. She delivered a healthy term baby 2 hours ago at home but has had significant PV bleeding since. She is conscious but her BP is 70/40.

1. What are the four (4) categories of causes for post partum haemorrhage? Give 2 examples of each.

<table>
<thead>
<tr>
<th>Category</th>
<th>Example</th>

2. Describe six (6) steps you would take to stop this woman’s bleeding.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

Your attempts at stopping the bleeding in the emergency department are unsuccessful. You contact the O&G registrar who states he is busy in theatre for the next 2 hours and is unable to attend.

3. Describe your response.

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________

SAQ 26

A 2 year old boy is brought to your emergency department by his grandparents having found him unresponsive at their home. He has no significant past medical history.

On examination he is very drowsy with a GCS of 7 (E2, V1, M4) and has the following observations:

- HR: 140 /min
- BP: 80/50 mmHg
- RR: 18 /min
- O2 saturation: 100% on 2L/min O2 via nasal cannulae
- Temperature: 36.5°C

His initial blood results are shown:

Venous blood gas

<table>

_____________________________________________________________________
_____________________________________________________________________

3. List four (4) immediate management priorities.

_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________
_____________________________________________________________________

4. What is the role of a nasogastric tube in this patient?

_____________________________________________________________________
Candidate number _______
SAQ 28

An 80 year old lady from home presents with sudden onset of shortness of breath and right sided pleuritic chest pain.

Her observations are as follows:

Temperature 37.5 °C
HR 120 /min
BP 90/60 mmHg
RR 30 /min
O₂ Saturations 92% on 10L O₂ via Hudson mask

Her CXR is normal. You suspect a pulmonary embolism.

1. What is the utility of a d-dimer this patient?

2. Discuss three (3) possible radiological investigations for this patient. Include two (2) pros and two (2) cons for each.

Candidate number ______
SAQ 30

A 24 year old male presents with confusion after competing in a half marathon event.

His observations are as follows:
- BP 95/60 mmHg
- HR 118 /min
- RR 24 /min
- O₂ saturations 98% on room air
- Temperature 40.8 °C
- GCS 13 (V3, E4, M6)

1. What is the most likely diagnosis?

2. List four (4) important investigations for this diagnosis. Include a justification for each.
